Catalogue number	Title	Price

12-515	Volume II — Classified Index	4.50
12-516	Volume III — Alphabetical Index (In preparation)	

INTRODUCTION

The structure of the Standard Commodity Classification and the principles used in its development are outlined in the Introduction to Vol. 1. The present volume contains a classified index in which alternative designations and commodity terms are shown under each class heading. The group and class headings are, of course, those contained in Vol. 1. The third volume consists of an Alphabetical Index in which the items shown in Vol. 2 are listed alphabetically, with some additions that are useful mainly in the alphabetical arrangement.

The lists of commodity terms under each class heading provide a brief definition of the commodity class by indicating its content in the form of examples. This provides a guide to those using the classification both with respect to the items to be included in a class and the interpretation of figures showing imports, exports, production or some other data for classes or groups.

It will be noted that the commodity classes differ in the degree of homogeneity of the commodities covered. It is not possible to maintain a given standard of homogeneity in the different classes because various commodity fields must be classified on different bases. In some cases the criterion is the kind of material used; in others it is the use or purpose to which the commodity is put; while other classes are distinguished on the basis of the capacity, weight or other characteristic of a particular commodity. The different practices followed have been determined on the basis of known requirements for statistical data. In some cases also they were designed to conform with the manner in which commodities are usually described on commercial documents.

Special Notes

When a class heading consists of more than one word, it has been indexed under each **key word**. Thus, it sometimes appears that the same designation has been repeated unnecessarily. When the designations are listed alphabetically, however, these different forms are required to aid in identifying the class regardless of how it is described. In many cases it was not necessary to cross-index commodity terms. Cross-indexing is limited also when a series of classes covers the same commodity but with different specifications, (e.g. woolen fabrics of different weights). In such cases the commodity terms can be referred to the group of classes and the class headings are self-explanatory.

A special effort has been made to assemble the different **parallel designations** used for the same commodity. These cases are encountered most frequently in the field of chemicals and chemical products.

Some **trade names** have been included when it was felt that they would assist in coding trade documents or otherwise in describing a class. Trade names are marked as follows—(T.N.) and they are used here only for the purpose of improving the statistics. If the mark (T.N.) has been inadvertently missed in any case, we would appreciate being informed.

The **spelling** in this volume follows, basically, the Oxford Dictionary. For purpose of coding import documents, however, it is necessary to include alternative spellings, particularly in the alphabetical arrangement. Since the same cards are used for this volume and Vol. 3, the alternative spellings are also found here. Such examples as tires and tyres, syrups and sirups, draughting and drafting, jewellery and jewelry, scarves and scarfs, orthopaedic and orthopedic, indicate the kinds of alternatives that have been included. Minor differences in spelling (e.g. colour and color) have not been duplicated, the Oxford spelling being the one used.

Differences in terminology have also been taken into account in deciding which terms to include. For example, both "baby carriage" and "pram" will be found in the list as will both "electronic tubes" and "electronic valves". No attempt has been made to account for all such terminological differences but only for those most commonly encountered.

Keeping the lists up-to-date

New commodities and new forms of existing commodities are encountered constantly. The files upon which these indexes are based are kept up-to-date by the insertion of new descriptions as they are encountered. It is difficult, however, to keep pace with all the new developments taking place in industrial processes and in the use of new materials. Gaps, errors or inconsistencies found in this volume should be reported to the Dominion Bureau of Statistics. From time to time supplementary lists will be issued and the whole list will be amended periodically.

CONCENTRATES OF METALS
ORES OF METALS
SCRAP OF METALS

Note: This division classifies metals in ores, concentrates and scrap and is to be used where the primary interest is in the metallic content of the ore. An alternative classification which classifies the ores, concentrates and scrap and which can be used where the primary interest is in tonnage of ore mined or transported is given in Appendix.

SECTION V—END PRODUCTS, INEDIBLE

Note: 1. Unless specified as a separate class, complete **parts** of any end product are classified with the product. Parts not clearly referable to any defined type are classified with the residual (n.e.s.) class in the appropriate group.

2. The term "Machinery" includes **attachments and accessories** often loosely described as "equipment". Where parts are specified as a separate class, related attachments and accessories are classified with the parts.
